Abstract

The invention relates to a device and a method for producing objects, for example
5 lipsticks, that are molded from paste-like materials, while using an elastic mold
part (28), into which the paste-like material is introduced by means of a filling
device, is hardened, and from which the at least largely hardened object is re-
moved by a removing device while said mold part is elastically stretched. It is
provided a dimensionally stable housing element (12) for housing said mold part,
10 wherein said housing element is held inside a stationary or moveable support of
said device, wherein said mold part (28) is placed in a housing space of said hous-
ing element at least during the filling and removal process, and
wherein said housing space can be enlarged for removing the object and/or a thin
fluid layer is placed between said mold part and said housing element, which is
15 removable from said housing element for the removal process. Such a production
mold prevents/limits the stretching of said mold part during filling and conse-
quently the production tolerances of the end product. The invention also relates to
a production mold for such a device.
